

Fictional case: reopening resets a note title

A fictional scenario for learning report writing. The environment and behavior below are example assumptions, not measured outages or reproduction counts.

Environment

Example setup: fictional Mora Notes / desktop browser / new note / no account data. Browser version, incident time and repetition count were not tested and remain unverified; record verified values in a real report.

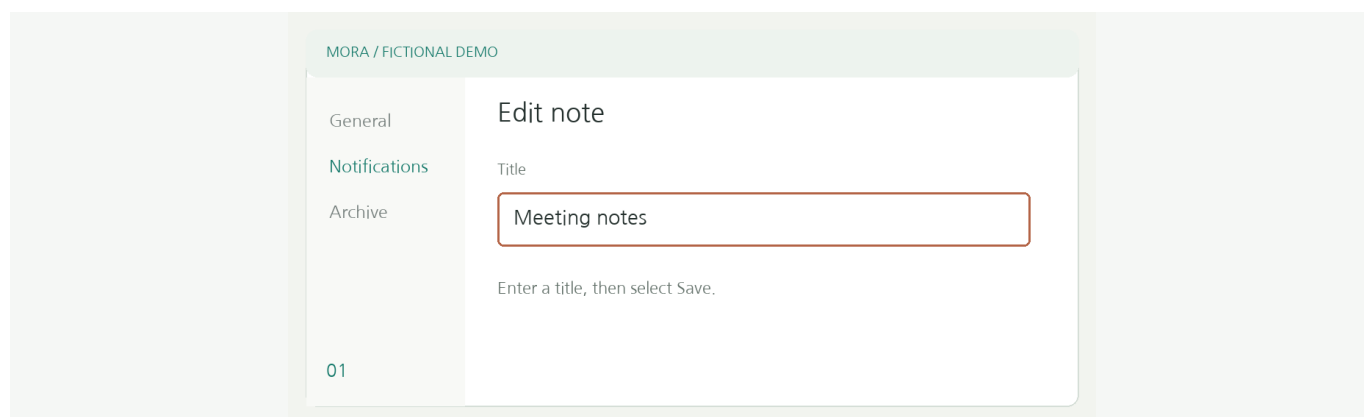

Expected

The title “Meeting notes” should remain after leaving for the list and reopening the same note.

Actual

In this fictional scenario, a saved message appears but reopening shows “New note”. Cause and reproduction frequency are unverified.

01 Create a new note and enter a title

01

Edit note

Title

Meeting notes

Enter a title, then select Save.

Assume a new note is named “Meeting notes” and its body is unchanged. This is original fictional screen artwork.

02 Save and reopen the same note from the list

Edit note

Title

New note

Observation: reopening resets the title.

The scenario returns to the list after the saved message, then reopens the same note. Compare the reset title with the expected result. This is not a claim of observed or repeated testing.
